# Tree Recursion

# Tree Recursion

- What is Tree Recursion?
  - Recursion, but with more recursive calls
  - Can break down the problem in more than one way
  - With all of the options drawn out, looks like a tree of recursive calls
- When and Why?
  - Useful when the original problem can be broken down in multiple ways
  - Accumulate all sub-problems with multiple recursive calls

# FIND EXAMPLE FOR FIB

# Lists

# Lists

- An indexed collection of any data type
- Examples of valid lists:
  - `[1, 2, 3]`
  - `[True, False, 'boo']`
  - `[[4], [3, 6, 7], [8]]`

# Creation and Usage

- In order to access the values in our list, we have to use the index
- Python lists are zero indexed, so the first element is at index 0
- `n` element is at `n-1` index
- Can also access elements in reverse order through negative index
  - Last element is accessed through index `-1` or `len(list) - 1`

```
>>> a = [1, 2, [3, 4]]
>>> a[0]
1

>>> a[2]
[3, 4]

>>> a[2][0]
3
```

# WWPD

# List Slicing

- How do you access a subset of the list?
- List slicing: creating a copy of part of the list
  - Syntax: `list[<start index>: <non inclusive end index>: <step size>]`
  - step size by default is 1
  - negative step size means list is reversed

# List Slicing Examples

```
>>> a = [7, 89, True, ['cat']]
```

```
>>> a[1:3]  
[89, True]
```

```
>>> a[:3:2]  
[7, True]
```

```
>>> a[::-1]  
[['cat'], True, 89, 7]
```

```
>>> a[:3:-1]  
[]
```

# List Comprehension

- How do you create a list that fits some criteria?  
e.g. How would you create a list with numbers 1 - 4, but squared  
`[1, 4, 9, 16]`
- List Comprehension: creating a list based on expressions filtering other lists
- Syntax: `[<expression> for <value> in <sequence> if <filter>]`
- `if` condition is optional

# List Comprehension Examples

```
>>> a = [x**2 for x in range(1, 5)]
```

```
>>> a  
[1, 2, 9, 16]
```

```
>>> [x/2 for x in [x for x in a if x % 2 == 0]]  
[1, 8]
```
