## Discussion 05

#### Mutability, Object Oriented Programming

Aditya Balasubramanian aditbala [at] berkeley [dot] edu

#### Announcements 📢

- Homework 2 due TODAY (7/7)
- CATS released!!!
  - Can have a partner
  - more time for this project
- Midterm a week from today
  - o all content through today's lecture (inheritance) will be in scope

7/7

- Logistics will come on Piazza
- Start studying!

# Mutability

#### List Mutation Functions

- append(elem)
  - box elem in list and add to end of lst (can lead to nested lists)
- extend(elem)
  - unbox elem and add to end (have to use an iterable)
- insert(index, elem)
  - insert elem at index (don't replace existing elem)
- remove(elem)
  - remove first appearance of elem in list (error if not found)
- pop(index)
  - o removes and return elem at index (default arg is end of list)

### **Mutating Lists**

- List Mutation Functions modify existing list
- Slicing creates a **new** list
- a = a + b creates a new list
- a += b mutates **existing** list (basically extend)
- Indexing into list and changing values modifies existing list

$$\circ$$
 a = [1, 2, 3]

$$\circ$$
 a[0] = 7

### Indentity vs Equality

- is
  - Check if two objects are the same (point to same reference in memory)
- ==
  - Check to see if content is the same
- Demo

```
>>> a = [7,6,4]
>>> b = [7,6,4]
>>> a is b
False
>>> a == b
True
```

## Shallow Copy and Deep Copy

- Shallow Copy
  - What Python does most of the time
  - Copy top level of list
  - Point to same objects with nested list
- Deep Copy
  - Make completely new copy of list
  - Difficult to do this
- Whenever we copy a sequence, we are using a shallow copy

## Object Oriented Programming (OOP) 🤐

## Object Oriented Programming (OOP)

- What is OOP?
  - Use of classes to define our own data types
    - More abstraction
  - Reuse code with inheritance
    - MORE ABSTRACTION
- Those with prior experience in Java are familiar
- You have already used OOP!
  - list.append
  - o append is a method belonging to the list class

### Some Terminology

- Class
  - Template for creation of object
- Object
  - An instance of a class
- Variables
  - Instance Variables
    - property specific to an object
  - Class Variables
    - property shared between all instances of a class
- Method
  - Function that is bound to a class

#### **Functions vs Methods**

- Methods need to take in self as an object
- self arguement tells which object to call method on
- Two methods of writing method calls
  - Class.method(self, args)
  - object.method(args)
    - self is automatically set as object
- Demo

### Thank you!
