Discussion 05

Mutability, Object Oriented Programming

Aditya Balasubramanian aditbala [at] berkeley [dot] edu

Announcements

- Homework 2 due TODAY (7/7)
- CATS released!!!
 - Can have a partner
 - more time for this project
- Midterm a week from today
 - o all content through today's lecture (inheritance) will be in scope
 - Logistics will come on Piazza
 - Start studying!

Mutability

List Mutation Functions

- append(elem)
 - box elem in list and add to end of lst (can lead to nested lists)
- extend(elem)
 - unbox elem and add to end (have to use an iterable)
- insert(index, elem)
 - insert elem at index (don't replace existing elem)
- remove(elem)
 - remove first appearance of elem in list (error if not found)
- pop(index)
 - o removes and return elem at index (default arg is end of list)

Mutating Lists

- List Mutation Functions modify existing list
- Slicing creates a **new** list
- a = a + b creates a new list
- a += b mutates **existing** list (basically extend)
- Indexing into list and changing values modifies existing list

$$\circ$$
 a = [1, 2, 3]

$$\circ$$
 a[0] = 7

Indentity vs Equality

- is
 - Check if two objects are the same (point to same reference in memory)
- ==
 - Check to see if content is the same
- Demo

```
>>> a = [7,6,4]
>>> b = [7,6,4]
>>> a is b
False
>>> a == b
True
```

Shallow Copy and Deep Copy

- Shallow Copy
 - What Python does most of the time
 - Copy top level of list
 - Point to same objects with nested list
- Deep Copy
 - Make completely new copy of list
 - Difficult to do this
- Whenever we copy a sequence, we are using a shallow copy

Object Oriented Programming (OOP)

Object Oriented Programming (OOP)

- What is OOP?
 - Use of classes to define our own data types
 - More abstraction
 - Reuse code with inheritance
 - MORE ABSTRACTION
- Those with prior experience in Java are familiar
- You have already used OOP!
 - list.append
 - o append is a method belonging to the list class

Some Terminology

- Class
 - Template for creation of object
- Object
 - An instance of a class
- Variables
 - Instance Variables
 - property specific to an object
 - Class Variables
 - property shared between all instances of a class
- Method
 - Function that is bound to a class

Functions vs Methods

- Methods need to take in self as an object
- self arguement tells which object to call method on
- Two methods of writing method calls
 - Class.method(self, args)
 - object.method(args)
 - self is automatically set as object
- Demo

Thank you!
