## Discussion 03

#### Recursion, Tree Recursion:)

Aditya Balasubramanian aditbala [at] berkeley [dot] edu

#### Announcements <

- Homework 1 due today (6/30)
- Lab 2 due today (6/30)
- Hog Checkpoint due tommorow (7/1)
- The tuition refund deadline to drop any session C summer course is July 1st.
  - There's also still lots of room in CS 10, if you're looking for a different pace than 61A—you can enroll in the class, and then reach out to cs10@berkeley.edu and they'll help catch you up.

6/30

### Agenda

- Mini Lecture Recursion
- Q2 walkthrough
- Q1
- Q3 / Q4 / Q5
- Mini Lecture Tree Recursion
- Q7
- Q8

# Recursion

## An Exciting Metaphor

- The Problem
  - Want to find how many dolls are inside this doll
- What we need to do
  - Create a function that we can repeat until there is no more dolls to count
- Ideas?

### Solution

• Remove one layer at a time and one to total, stop when there is no more dolls and add one

# Dish Washing Example INTERACTIVE!

20 dishes to wash on a Sunday morning

#### Recursion

- What is a recursive function?
  - A function that calls itself
  - Returns a function call of itself, not the object (different than HOF)
- Recursive Leap of Faith
  - The idea that the recursive function will work no matter what/how many test cases are passed in

### Solution in Formal Terms of Recursion

- Base Case
  - o smallest problem with guranteed answer, or smallest input
  - A doll with no other dolls inside of it
  - One dish left
- Recursive Call
  - A method of reducing the current problem into a smaller problem
  - Removing each layer one by one and adding it to a total
  - Making a clone to wash dishes

### Recursion vs Iteration

- Recursion
  - Make problem smaller
  - Variables get reset
  - Many frames will open
    - Lot of memory taken up
  - Better for some problems
    - Recursive Data Structures (Trees, Linked Lists)
- Iteration
  - Loops happen in one frame
  - Easy to visualize
  - No additional function calls

## Q2: Recursion Environment Diagram

Draw an environment diagram for the following code:

```
def rec(x, y):
    if y > 0:
        return x * rec(x, y - 1)
    return 1

rec(3, 2)
```

## Q1: Recursive Multiplication (7 min)

Write a function that takes two numbers m and n (only positive) and returns their product. Use recursion, not mul or \*

```
def multiply(m, n):
    """ Takes two positive integers and returns
    their product using recursion.
    >>> multiply(5, 3)
    15
    """
    "*** YOUR CODE HERE ***"
```

## Q3: Find the Bug (3 min)

Find the bug with this recursive function.

```
def skip_mul(n):
    """Return the product of n * (n - 2) * (n - 4) * \dots
    >>> skip_mul(5) # 5 * 3 * 1
    15
    >>> skip_mul(8) # 8 * 6 * 4 * 2
    384
    11 11 11
    if n == 2:
        return 2
    else:
        <u>return n * skip_mul(n - 2)</u>
```

## Choose your own adventure !!!

Q3 , Q4 , Q5

## Tree Recursion

#### **Tree Recursion**

- What is Tree Recursion?
  - Recursion, but with more recursive calls
  - Can break down the problem in more than one way
  - With all of the options drawn out, looks like a tree of recursive calls
- When and Why?
  - Useful when the original problem can be broken down in multiple ways
  - Accumulate all sub-problems with multiple recursive calls

### Recursive Fibonacci

```
def fib(n):
    if n == 0:
        return 0
    elif n == 1:
        return 1
    else:
        return fib(n - 1) + fib(n - 2)
```

- Need to look at fib(n 1) and fib(n-1)
- All steps of recursion present
  - Base Case
  - Recursive Calls
  - Applying to solve problem

### Q7: Count Stair Ways

How many different ways are there to go up a flight of stairs with n = 1 step? How about n = 2 steps? Try writing out some other examples and see if you notice any patterns.

```
def count_stair_ways(n):
    """Returns the number of ways to climb up a flight of
    n stairs, moving either 1 step or 2 steps at a time.
    >>> count_stair_ways(4)
    5
    """"
    "*** YOUR CODE HERE ***"
```

### Q8: Count K

Consider a special version of the count\_stair\_ways problem, where instead of taking 1 or 2 steps, we are able to take up to and including k steps at a time. Write a function count\_k that figures out the number of paths for this scenario. Assume n and k are positive.
